Invention The present invention relates to a structure of a single-ended to differential circuit converter and a circuit configuration for use in the circuit converter. 2. Description of the Related Art

Circuits that combine one or more single-ended differential circuits into a single-ended differential circuit and a differential circuit into a single-ended differential circuit and drive the circuit with a single-ended power source are disclosed in Japanese Unexamined Patent Application Publication No. 2006-222462 and Japanese

Unexamined Patent Application Publication No. 2013-238706. In a conventional single-ended to differential circuit converter, the number of loads is generally set to two, and each load is formed by a single-ended circuit. For this reason, when the number of loads is set to more than two, a multiplexer having a plurality of inputs is required to be added to the single-ended to differential circuit converter to connect the plurality of loads to the single-ended to differential circuit converter. FIG. 2 shows a circuit configuration of a single-ended to differential circuit converter that is disclosed in Japanese Unexamined Patent Application Publication No. 2006-222462. FIG. 3 shows a circuit configuration of a single-ended to differential circuit converter that is disclosed in Japanese Unexamined Patent Application Publication No. 2013-238706. In FIGS. 2 and 3, each load includes a p-channel MOSFET (PMOS) and an n-channel MOSFET (NMOS). To allow a plurality of loads to be driven by a single-ended power source, MOSFETs (PMOSs and NMOSs)

are disposed to bypass loads that require no power supply. In the case of FIG. 2, a first PMOS 111, a second PMOS 112, a first NMOS 113, and a second NMOS 114 are disposed between an input terminal #1 of a first one of the loads and an input terminal #2 of a second one of the loads. In the case of FIG. 3, a first PMOS 111, a second PMOS 112, a first f678ea9f9e
